

The Complete Beginner's Guide to Teldrive (Windows)

Turn your Telegram account into an unlimited, streaming cloud drive with zero complex local database setup.

Phase 1: Downloading the Correct File

The official GitHub instructions require complex coding knowledge and a painful local database setup. We are bypassing all of that by downloading the pre-packaged Windows version directly from SourceForge.

1. Go to SourceForge: Open your web browser and go to the official mirror: [Teldrive SourceForge Link](https://sourceforge.net/projects/telegram-drive.mirror/files/1.8.3/)

<https://sourceforge.net/projects/telegram-drive.mirror/files/1.8.3/>

2. Download the App: Look through the list and click on the file named exactly **teldrive-1.8.3-windows-amd64.zip** (approx. 19.2 MB).

3. Create the Main Folder: Open your C: drive in Windows File Explorer. Right-click, create a new folder, and name it exactly **teldrive**.

4. Extract Carefully: Open your downloaded .zip file. Inside, you will see a file named **teldrive.exe**. Drag and drop this file directly into your new C:\teldrive folder.

BEGINNER TRAP

Do not put it inside a folder within a folder. The path must be exactly **C:\teldrive\teldrive.exe**.

Phase 2: Getting Telegram Credentials

Teldrive needs secure permission to talk to Telegram on your behalf.

1. Get the API Keys

- Go to my.telegram.org and log in.
- Click on **API development tools**.
- If asked for an app name, type any random word.
- Copy two things: your **App ID** and your **App Hash**.

2. Create the Storage Bucket

- Open the Telegram app on your phone or PC.
- Create a **New Channel**.
- Name it "**My Cloud Drive**".
- Set the channel type to **Private**.

3. Create a Bot Worker

- Search for **@BotFather** in Telegram (look for the verified checkmark).
- Send the command `/newbot`. Give it a name and a username ending in "bot".
- BotFather will reply with an HTTP API Token (e.g., 123...:ABC...). **Copy this token.**

4. Link the Bot

- Go back to your private "My Cloud Drive" channel.
- Click channel name → **Administrators** → **Add Admin**.
- Search for your new bot and add it. **Crucial:** Ensure the **"Post Messages"** permission is enabled so it can upload files.

Phase 3: Database (The Supabase Shortcut)

This step replaces the headache of installing PostgreSQL locally. Supabase hosts the database for you in the cloud for free.

1. Go to [Supabase.com](https://supabase.com), sign up, and click **New Project**.
2. Give your project a name and create a **strong database password**. Write it down!
3. Once built (takes ~2 mins), click the **Gear Icon** (Settings) on the left → **Database**.
4. Scroll to the **Connection String** section, click the **URI** tab, and copy that entire link.

THE PORT 6543 RULE

Look at the link you just copied. Near the end, if it says `:5432`, you **must** manually change it to `:6543`. This forces the database into pooler mode and prevents crashing.

Phase 4: The Configuration File

- 1. Show File Extensions:** In File Explorer, click **View** → **Show** → check **File name extensions**.
- 2. Open Notepad:** Copy and paste the text below exactly as it appears.

```
[db]
data-source = "postgresql://postgres:REPLACE_WITH_PASSWORD@your-supabase-
link.com:6543/postgres"
prepare-stmt = false

[jwt]
secret = "type_any_random_words_here"

[tg]
app-id = REPLACE_WITH_APP_ID
app-hash = "REPLACE_WITH_APP_HASH"
auto-channel-create = false

[server]
port = 8080
```

Fill in the Blanks:

- **data-source:** Replace the link with the Supabase URI. Change REPLACE_WITH_PASSWORD to your password. (Remove [] brackets).
- **app-id:** Replace with your Telegram App ID number.
- **app-hash:** Replace with your Telegram Hash (**Keep the quotation marks!**).

 **Save the File:** Click **File** → **Save As**. Change "Save as type" to **All Files (*.*)**. Save it directly into **C:\telldrive** and name it exactly **config.toml**.

Phase 5: Launching the App

1. Click your Windows Start button, type **PowerShell**, and open it.
2. Type the following command and press Enter:
3. Type the launch command and press Enter:
*(If Windows Firewall pops up, click **Allow**).*
4. Open your browser and go to <http://localhost:8080>. Log in using your Telegram phone number.
5. Click your **Profile Icon** (top right) → **Settings**.
6. Go to the **Bots** tab. Paste your BotFather token and click **Add**.
7. Go to the **Channels** tab. Click on your "My Cloud Drive" channel so it highlights.

Phase 6: The VLC Streaming Fix

Web browsers have a strict bug that breaks VLC streaming links. These invisible scripts fix the bug so you can stream 4K movies directly from your new cloud.

1. Create the VBS Wrapper

```
Set objArgs = WScript.Arguments
If objArgs.Count > 0 Then ... (See webpage for full code)
```

Save as **All Files (*.*)** into C:\telldrive\ named exactly **vlc-wrapper.vbs**.

2. Create the Registry Fix

Save as **All Files (*.*)** to your **Desktop** named exactly **vbs-fix.reg**.

3. Apply the Fix & Configure VLC

- Double-click the vbs-fix.reg file on your Desktop and click **Yes**.
- Open VLC Media Player. Go to **Tools → Preferences**.
- At the bottom left, set "Show settings" to **All**.
- Click **Input / Codecs** on the left, scroll to **Network caching (ms)** on the right, and change it to **30000**.
- Click **Save**.

Phase 7: Keeping it Running (Background Mode)

If you close the PowerShell window, Teldrive stops working. To keep it running silently in the background whenever you turn on your computer, follow these quick steps:

1. Create the Silent Script: Open a new Notepad, copy the code below, and save it as **start-teldrive.vbs** directly into your `C:\teldrive\` folder (Save as All Files *.*).

```
Set WshShell = CreateObject("WScript.Shell")
WshShell.CurrentDirectory = "C:\teldrive"
WshShell.Run "cmd /c .\teldrive.exe run -c config.toml", 0, False
```

Add to Windows Startup

- Press **Win + R** on your keyboard, type `shell:startup`, and press Enter. This opens your Windows Startup folder.
- Go to your `C:\teldrive\` folder, right-click your new **start-teldrive.vbs** file, and click **Copy**.
- Go back to the Startup folder, right-click an empty space, and click **Paste shortcut**.
- Teldrive will now automatically run invisibly every time you turn on your PC!

You're all done! 🎉

You can now upload, manage, and stream files directly through Teldrive.
